```
The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder,
                                                                                                                                                                                                                                                                                         including a disorder of motoneurones and/or neurodegenerative disorder, eg., amyokrophik lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, of a post-polio syndrome, a disorder caused by exposure to a poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                      toxin, motoneurone trauma, a microneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, peripheral neuropathies, Alzahimer's disease and Parkinson's disease. The present sequence is human IGF-I isoform MGF MGF is a muscle isoform having extracellular (EC) domain, hence also referred as IGF-I.Ec. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rabbit; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; menyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
               Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to use of mechano-growth factor (MGF),
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable.
Cof reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
cof rescue. The MGF polynucleotide and polypeptide are useful in the
manufacture of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
cof amyotrophic lateral sclerosis, spinal muscular atrophy,
cof spinal muscular atrophy, infantile or juvenile muscular atrophy,
cof poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
comparative that affects motoneurone lesion or nerve damage, an
injury that affects motoneurones, motoneurone loss associated with aging,
autosomal or sex-linked muscular dystrophy, diabetic neuropathy,
cof peripheral neuropathies, Alzheimer's disease and Parkinson's disease.
Cof peripheral neuropathies is rabbit GEO; domain, hence also referred as
cof isoform having extracellular (EC) domain, hence also referred as
cof coffice and sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1;

                                                                                                                                                                                                                                                                                                                                      1;
                                                                                                                 A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute hear failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabeled 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver CDNA library. Insulin-like growth factors-IA and -1B cDNAs were isolated from a human cDNA library by using lambdagt 11 (AAN70435, AAN70436). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-1 proteins. An essentially pure proproinsulin-like growth factor-1 protein comprising the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, peripheral neuropathies, Alzhaner's disease and Parkinson's disease. The present sequence is rat IGF-I isoform MGF MGF is a muscle isoform having extracellular (EC) domain, hence also referred as isoform having extracellular (EC) domain, hence also referred as since isoform lateral catid sequence of IGF-I exons 4, 5 and 6 in the reading frame

Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -

Disclosure; Fig 8; 66pp; English.

The present invention relates to use of mechano-growth factor (MGF),

```
ö
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynuclechide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                            toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human liver-type IGF-I isoform (L.UGF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Regulating memory consolidation in an animal comprising treating with an agent that modulates activity of one or more genes from z1f268, insulin-like growth factor, glutamate receptor 2, c/EBPbeta and VGF \,

The invention relates to modulating long term memory consolidation in an animal comprises treating with an agent that modulates the activity of one or more of genes from zif208, insulin-like growth factor (IGF), glutamate receptor 2 (GluR2), c/EBPbeta and neuroendocrine VGF (neurotroplu-inducible gene). The method is useful for indentified a drug and/or target discovery business, which comprises conducting a drug and/or target discovery business, which comprises conducting therapeutic profiling of the agents (or their comprises conducting therapeutic profiling of the agents of formulating a pharmaceutical preparation including one or more agents (or analogues) identified, for efficacy and toxicity in animals, and formulating a pharmaceutical preparation including one or more agents (or a third party the rights for further drug development of the comprises an additional step of establishing a distribution system for distributing the preparation for sale and may optionally controlling as alses group for marketing the preparation. A pharmaceutical composition containing the agent is useful for enhancing memory consolidation in an animal, or for augmenting learning and memory, or otherwise for enhancing the functional performance of central nervous system neurons, where the agent is a cAMP elevating agent (agonts) or otherwise for enhancing the functional performance of central nervous system neurons, where the agent is a cAMP elevating agent (agonts) or otherwise for enhancing disabilities, memory impairment e.g. cativates adenylate cyclase. The composition is useful for treating clue to toxicant exposure, brain injury, epilepsy, mental retardation in children and senile dementia, including Alzheimer's disease. The

The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the C mature protein is terminated by a D domain at the C -terminus. The D domain sequence was used to synthesis peptides (AARB3801-2) that include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-1 receptor (IGF-1R) via the D domain and induces activation of the IGF-1R by autophosphorylation of the IGF-1R.

Activated IGF-1R is associated with cellular growth and proliferation. The synthetic peptides are useful as inhibitors of IGF-1R.

The synthetic peptides are useful as inhibitors of IGF-1 binding to IGF-1R and thus may be used in the treatment of disorders characterised by undesirable cell proliferation eg. cancer, restenosis, asthma, burns,

This sequence is the invalid factor of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the coll cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3' flanking region, including a 3' untranslated cassociated; and (d) a 3' flanking region, including a 3' untranslated acid, the position for inserting the nucleic acid cassette and comprises a sequence from a growth hormone 3'-UPR. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy, clabetes, neuropathy, osteoporosis, and growth disorders. They can be used for treating peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, and cancer and cancer and seamone and side-effects from anti-cancer and contained the contained of the provider of the monthlia, inflammation and side-effects from anti-cancer and contained the contained of the cast of the
                                        sequence is the human insulin-like growth factor I (IGF-I).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               109 CAPLKPAKSARSVRAQRHTDMPKTQK 134

                                                                                                                                                                                                         A method has been developed of treating urinary incontinence (UI) in mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and

                                                                                                         progressive
                                                A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ea isoform used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -

medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, politome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an
                                                                                                                                                                                                                                                                                                                                               injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rabbit livertype IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The present sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification. However it differs at few positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                      The sequence is human prepro-somatomedin-C. DNA probes prepared against DNA encoding the protein sequence may be used to detect the presence of the genes in a natural source. The probes may be used to detect mutations and/or deletions in humans suffering from growth deficiencies. See also AAN60489, AAN60491

The present invention relates to use of mechano-growth factor (MGF),

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable

of reducing motoneurone loss by 20% or greater in response to nerve

avulsion, and effects motoneurone rescue, preferably adult motoneurone

caveling and selects motoneurone rescue, preferably adult motoneurone

can manufacture of a medicament for the treatment of a neurological disorder,

including a disorder of motoneurones and/or neurodegenerative disorder,

consular anyotrophic lateral sclerosis, spinal muscular atrophy,

poliomypelitis or post-polio syndrome, a disorder caused by exposure to a

consular atrophy, infantile or juvenile muscular atrophy,

consular atrophy, infantile or juvenile muscular atrophy,

consular atrophy, infantile or juvenile muscular atrophy,

containing that affects motoneurones, motoneurone loss associated with aging,

autosomal or sex-linked muscular dystrophy, diabetic neuropathy,

contoneurone transmers, alternative version of rabbit liver-type IGF-I

consoded by nucleic acid sequence is stated as being the same as SEQ ID NO:14

shown in sequence listing (AAE02452) of the specification. However

insulin-like growth factor I precursor, splice form 1 - sheep
NALternate names: somatomedin C
C; Species: Ovis orientalis aries, Ovis ammon aries (domestic sheep)
C; Species: 09-Mar-1990 Hsequence_revision 27-Feb-1997 #text_change 23-Jul-1999
C; Accession: S22877; A33390; S07965; S07198

Environ. Mass Spectrom. 16:3-8(1988).

-I. FUNCTION. THE INSULIN-LIKE GROWTH PROMOTIN RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-I. SUBELLULAR LOCATION: Secreted.

-I. ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE PRODUCED BY ALTERNATIVE SPLICING.

-I. SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi M., Yasuda T., Kobayashi Y.; "IH-NMR assignment and secondary structure of human insulin-like growth factor-I (IGF-I) in solution."; J. "Sequences of liver cDNAs encoding two different mouse insulin-like
growth factor I precursors."
"Sequences of liver cDNAs encoding two different mouse insulin-like
growth factor I precursors."

- I FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

- I SUBCELLUIAR LOCATION: Secreted.
- ALTERNATIVE PRODUCTS: I ISOFORM IGF-IA (AC POSO17) AND
ISOFORM IGF-IB (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING.
- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.

"Primary structure of rat insulin-like growth factor-I and its
biological activities.";

J. Biol. Chem. 264:5616-5621(1989).

-I- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,

ARE STROCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A

MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-I- SUBCELLULAR LOCATION: Secreted.

-I- SUBCELLULAR LOCATION: Secreted.

-I- SUBCELLULAR LOCATION: SECRETED.

-I- SUBCRICHOLAR LOCATION: SECRETED.

-I- SHERNATIVE PRODUCTS: 2 ISOFORMS; ISOFORM IGF-IA (AC PO8025) AND

-I- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              49 GPETLCGAELVDALQFVCGPRGFYFNKPTGYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 108

"Location of disulphide bonds in human insulin-like growth factors
(IGFS) synthesized by recombinant DNA technology.";
Biomed. Environ. Mass Spectrom. 16:3-8(1988).
-!-FOWATION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FINCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE
PRODUCED BY ALTERNATIVE SPLICTING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi I Yasuda T., Kobayashi Y.;
